Key Features

- Wireless display
- Super-large 50mm digits
- Solar powered
- 300 hours autonomy
- Backlighting in orange or red
- Totally waterproof to 10m
- Lightweight only 360g

A wireless Maxi Display with high contrast, super-large digits, providing highly visible and accurate data in all conditions from anywhere on your boat without any wiring restrictions. The choice of red and amber backlighting to three levels allows you to select a different colour for different data displays. You can customize the display to show only the data options you want to see, minimizing the time it takes to select the pages you really need. Alternatively you can use the 'Auto Leg' function which changes the display automatically to show the information you need for each leg of the course without the need to press a button. You can maximize your performance using the Line Bias, Wind Shift and Timer functions as well as indicators for acceleration and speed trend. In tidal waters the Set, Drift, Turn and Course to Steer functions will give you the edge by helping you to spot your tides. The Remote Display not only provides you with additional performance data and graphing pages to monitor trends but is also essential to control and configure your Maxi Displays from anywhere on the boat. As well as providing wireless stand alone systems Tacktick displays can also be integrated into other electronics systems, such as B&G, Raymarine and Simrad.

For more information and pricing on the full range of wireless electronics systems contact Tacktick or your local Tacktick distributor.
